

Urinary retention can be cured

Is urinary retention treatable?

Urinary retention can be painful and inconvenient. When it appears suddenly and leaves a person unable to urinate, it can be excruciating and very scary. Delaying treatment only allows the condition to get worse. Urinary retention is treatable, and there is no need to feel embarrassed or ashamed. A doctor can often diagnose the problem.

How is urinary retention treated?

Since the acute form of urinary retention is a medical emergency, your healthcare provider will insert a catheter to drain your bladder. This should provide almost immediate relief. After that, they'll work to determine the cause and the appropriate treatment. Treatment of the chronic form will depend on the cause.

What if I have chronic urinary retention?

If you have chronic urinary retention, your health care professional will first try to diagnose and treat the cause of your retention. However, your health care professional may need to use a catheter to drain the urine from your bladder if the retention continues or becomes severe.

Is urinary retention a disease?

Urinary retention is not a disease but a symptom related to health problems directly or indirectly affecting the urinary tract. The symptoms can vary based on whether the condition is acute or chronic. Acute urinary retention develops suddenly and sometimes severely.

Can a person with acute urinary retention urinate?

People with acute urinary retention are unable to urinate even though they have a full bladder. Acute urinary retention can cause severe pain and be life threatening. If you are suddenly unable to urinate, it's important that you seek emergency medical treatment right away. Chronic urinary retention develops over time.

What happens if urinary retention is left untreated?

Left untreated, urinary retention can cause severe pain, discomfort, and other medical issues. In some cases, this condition can be life-threatening. You may need to seek emergency medical treatment. A combination of medical and home treatments may ease symptoms and improve your quality of life. Here are five bladder retention remedies:

The complete inability to urinate--called urinary retention--is always a medical emergency. In people who have had surgery, the type of procedure, anesthesia used, and post-operative medications can all contribute to urinary retention. It usually gets better in a few weeks.

People with urinary retention may experience an acute (sudden) or chronic (over time) form of the condition. Acute urinary retention arises suddenly and is associated with extreme discomfort; it may be life-threatening

Urinary retention can be cured

in some cases. Chronic urinary retention, however, may not cause noticeable symptoms because it may develop slowly over time.

If this is the first episode of acute urinary retention, arrange hospital admission. If the expertise and facilities are available, catheterize before admission. Otherwise, admit the man urgently for catheterization and investigation of the cause. If the man has recurrent acute retention or acute-on-chronic urinary retention, admit the man or insert a urethral catheter.

An American Urological Association (AUA) white paper titled Non-Neurogenic Chronic Urinary Retention: Consensus Definition, Management Strategies, and Future Opportunities states that a reasonable definition of non-neurogenic chronic urinary retention (CUR) is a bladder volume \geq 300 ml documented twice in a 6-month period. Furthermore, it, classifies urinary retention ...

The experience of uncontrollably leaking urine can be an embarrassing issue for many people. Urinary incontinence is a loss of bladder control that's commonly seen in older adults and women who have given birth or gone through menopause. Urinary tract infections (UTIs), pelvic floor disorders and an enlarged prostate are other causes.

INTRODUCTION. Acute urinary retention (AUR) is the inability to voluntarily pass urine. It is the most common urologic emergency [1] In males, AUR is most often secondary to benign prostatic hyperplasia (BPH); AUR is rare in females [2] AUR is a urologic emergency that requires immediate treatment by insertion of a urinary catheter that allows the bladder to empty.
