One common approach is to classify them according to their form of energy stored; based on this method, systems which use non chemically solution water as their primary storage medium for solar applications, can be fell into two major classes: thermal ...

2.1 Sensible-Thermal Storage. Sensible storage of thermal energy requires a perceptible change in temperature. A storage medium is heated or cooled. The quantity of energy stored is determined by the specific thermal capacity (c_p -value) of the material. Since, with sensible-energy storage systems, the temperature differences between the storage medium ...
