How does a cascade storage system work?

In a cascade storage system, reservoir tanks are filled on a priority identified by an algorithm. The on-board NGV cylinder is switched from the lower pressure reservoir to the higher one, when the mass flow rate drops to a certain limit. In contrast, in a buffer storage system, reservoir tanks are maintained at the same pressure.

Schematic illustration of production, energy cascade and dissipation in the energy spectrum of turbulence. The largest motions, or eddies, of turbulence contain most of the kinetic energy, whereas the smallest eddies are responsible for the viscous dissipation of turbulence kinetic energy.
