Which type of energy storage device is used in EV application?

In ESS, different types of energy storage devices (ESD) that is, battery, super capacitor (SC), or fuel cell are used in EV application. The battery is stored in the energy in electrochemical and delivers electric energy. Where SC has stored energy in the form of static electric charge and mainly hydrogen (H_2) is used in the fuel cell.

What is a hybrid energy storage system?

1.2.3.5. Hybrid energy storage system (HESS) The energy storage system (ESS) is essential for EVs. EVs need a lot of various features to drive a vehicle such as high energy density, power density, good life cycle, and many others but these features can't be fulfilled by an individual energy storage system.

What are the different types of energy storage systems?

Among these techniques, the most proven and established procedure is electric motor and an internal combustion (IC) engine (Emadi, 2005). The one form of HEV is gasoline with an engine as a fuel converter, and other is a bi-directional energy storage system (Kebriaei et al., 2015).

The main focus of the paper is on batteries as it is the key component in making electric vehicles more environment-friendly, cost-effective and drives the EVs into use in day to day life. Various ESS topologies including hybrid combination technologies such as hybrid electric vehicle (HEV), plug-in HEV (PHEV) and many more have been discussed.

Which fuel cells are used in hybrid electric vehicles?

Among all these, phosphoric fuel cells and methanol fuel cells are used in hybrid electric vehicles because they are easily connected in parallel with lead-acid/Ni-Cd battery to supply peak power and to have a good advantage in regenerative braking (Dincer and Bicer, 2018).

Why is ESS required to become a hybrid energy storage system?

So, ESS is required to become a hybrid energy storage system (HESS) and it helps to optimize the balanced energy storage system after combining the complementary characteristics of two or more ESS. Hence, HESS has been developed and helps to combine the output power of two or more energy storage systems (Demir-Cakan et al., 2013).
