Really a tank is a tank. Anytime we use a tank for storage of hot or cold water it could be a buffer, storage or both. We usually think of a buffer tank as one that stores thermal mass (sort of like a "flywheel") so a heating or cooling source doesn't cycle too much when smaller loads are turning on and off.

The sensible heat of molten salt is also used for storing solar energy at a high temperature, [10] termed molten-salt technology or molten salt energy storage (MSES). How Thermal Energy Storage Works. Thermal energy storage is like a battery for a building"s air-conditioning system. It uses standard cooling equipment, plus an energy storage tank to shift all or a portion of a building"s cooling needs to off-peak, night time hours. During off-peak hours, ice is made and stored inside IceBank energy storage tanks.

TES Tank Sized for 4 hours of full cooling capacity storage as compared to 10 to 15 minutes of current common practice. i.e. if a data center with IT load of 4,000 kw would typically require 5,200 to 5,600 KW (1.3 to 1.4 x IT load) of cooling capacity and hence the thermal storage capacity should be 4 Hrs. x 5,600 kw = 22,400 kwh or 6,370 Ton-Hr.
