If you use the utility billing mechanism known as time-of-use, and don't have a solar energy system, your electricity in the evening is likely more expensive because of the higher demand on the system. With battery storage, however, you can use electricity generated during the day later on, rather than relying on the utility for power.

A 240 MWh battery could power 30 MW over 8 hours, but depending on its MW capacity, it may not be able to get 60 MW of power instantly. That is why a storage system is referred to by both the capacity and the storage time (e.g., a 60 MW battery with 4 hours of storage) or--less ideal--by the MWh size (e.g., 240 MWh).

Why not use battery energy storage

An Introduction to Battery Energy Storage Systems. Battery Energy Storage Systems comprise several key components: the battery cells that store electrical energy, housed in a module managed by a Battery Management System (BMS); an inverter that converts the stored DC power into AC power usable by the grid; and a sophisticated Management System ...

Various technologies are used to store renewable energy, one of them being so called "pumped hydro". This form of energy storage accounts for more than 90% of the globe 's current high capacity energy storage. Electricity is used to pump water into reservoirs at a higher altitude during periods of low energy demand.

The battery energy storage system's (BESS) essential function is to capture the energy from different sources and store it in rechargeable batteries for later use.
