

Why is energy storage important in wind energy system?

Hence, energy storage plays a major role in the effective utilization of the wind energy system owing to the intermittent nature of wind. Various energy storage technologies are available worldwide. Among them, the Compressed Air Energy Storage System (CAES) has proven to be the most eco-friendly form of energy storage.

What is wind-driven compressed air energy storage (CAES)?

With an increasing capacity of wind energy globally, wind-driven Compressed Air Energy Storage (CAES) technology has gained significant momentum in recent years. However, unlike traditional CAES systems, a wind-driven CAES system operates with more frequent fluctuations due to the intermittent nature of wind power.

Is a wind-driven air storage system feasible?

Thus, the operational feasibility of the proposed wind-driven air storage system is proved. Wind energy is converted into electricity in the conventional wind turbine generators and either evacuated or stored in batteries for due consumption (Hartmann et al. 2012).

Are compressed air energy storage systems eco-friendly?

Among them, the Compressed Air Energy Storage System (CAES) has proven to be the most eco-friendly form of energy storage. One of the biggest projects being carried out now is the Iowa Stored Energy Park, with 2700 MW of turbine power. CAES system uses a compressor at the outlet of the wind turbine, compressing the air at high pressures.

Can a wind-CAES tank be used to store compressed air?

As mentioned earlier, following the charging process, compressed air is stored under high-pressure. Thus, finding a location with high wind potential and suitable geologies for CAES storage components is critical for wind-CAES integration. Using an artificial tank for large-scale CAES storage proved not to be economically viable.

Can compressed air energy storage systems be used on a large scale?

Hence, presently, compressed air energy storage systems are not used on a large scale (Wang et al. 2017). On the other hand, Hao Sun et al. (2015) analyzed the feasibility operation of a small-scale compressed air energy storage (CAES) sub-system which proved to have an efficiency of 55% under various operating conditions.
