energy is stored in another storage medium [4]. Steam accumulation is the simplest heat storage technology for DSG since steam is directly stored in a storage pressure vessel, i.e., steam accumulator, in form of pressurized saturated water [5]. Discharging from steam accumulators usually takes place from the top part of the

While a steam tank holds 2.4~ish GJ, each heat pipe unit stores 0.5 GJ and a reactor 5GJ. So there's actually a massive energy buffer even with no tanks. Personally I just use a steam tank to gauge how much steam is inside the pipes, sending the result to the circuit network and eventually inserting fuel only when steam is lower than like 20k.

Anyways, steam storage tanks are just energy storage, and if you think about it the available coal is also stored energy waiting to be used. Converting it from one type of storage to the other is usually of limited benefit. One storage tank of 165 C steam holds up to 750 MJ of energy, which is equal to 187.5 pieces of coal, which sounds like ...

A 500°C steam storage tank is 222 times more space efficient at storing energy than an accumulator as of v0.16.51 (215.56 times if ambient 15°C is taken into account but I didn't notice it having an effect in testing) and with Factorio physics, steam doesn't cool down.
