Deterministic and probabilistic battery SOC estimation plays a vital role in developing the energy storage battery industry. In this study, a novel SOC estimation method ...

He was a visiting student at the University of Waterloo to research in the field of secondary batteries from 2016 to 2017. His research interests are materials and devices for electrochemical energy storage and conversion. Yuxin Tang, currently is a professor in the College of Chemical Engineering at Fuzhou University. He obtained his PhD ...

The \$10.95 million four-year grant establishes a Department of Energy research facility called the "Mechano-chemical Understanding of Solid Ion Conductors" (MUSIC). University of Michigan established the program in 2009, and it is designed to "tackle the toughest scientific challenges preventing advances in energy technologies."

As a result, pairing this aligned membrane with a vanadium flow battery leads to a high energy efficiency of $\geq 80\%$ at 200 mA cm^{-2} and remarkable stability over 1,000 cycles. This work enables the design of membranes that combine otherwise mutually exclusively properties for many possible applications beyond energy storage.

Download figure: Standard image Each battery in the pack is considered as a cylindrical battery as shown in Fig. 1(b). The three-dimensional battery model consists of the following components: cylindrical battery connector on top of the battery (steel), mandrel (nylon isolator around which the battery sheets are wound), active battery material (wound sheets of ...

Accurate and real-time state-of-charge (SOC) estimation for lithium-ion batteries (LiB) is crucial for battery management system. However, the nonlinearity and complex dynamic properties of LiB pose a great challenge to the estimation of SOC. Some previous methods have undertaken high-precision SOC point estimation; however, the reliability of the estimated results has not been ...

During the past 30 years, lithium-ion batteries have become an indispensable and important way of energy storage in our daily life [1], [2], [3]. However, the ever-increasing concerns caused by the conflict between the ever-increasing lithium consumption and the lack of adequate lithium resources bring many hardships to their application in new ...

Tehachapi Energy Storage Project, Tehachapi, California. A battery energy storage system (BESS) or battery storage power station is a type of energy storage technology that uses a group of batteries to store electrical energy. Battery storage is the fastest responding dispatchable source of power on electric grids, and it is used to stabilise those grids, as battery storage can ...

The world is suffering from chronic water shortage due to the increasing population, water pollution and industrialization. Desalinating saline water offers a rational choice to produce fresh water thus resolving the crisis. Among various kinds of desalination technologies, capacitive deionization (CDI) is of significant potential owing to the facile process, low energy ...

Our research focuses on rational design of energy storage materials and functional electrolytes towards practical application for advanced battery systems working in extreme conditions. Our approach is interdisciplinary, covering from materials science and engineering, physics chemistry (electrochemistry), chemical engineering, and electrical ...

Impressively, our battery could display a very high energy density of 353.1 Wh kg⁻¹ at a good power density of 50 W kg⁻¹ and maintain its energy density of 163.4 Wh kg⁻¹ even at a superior density of 10,000 W kg⁻¹ (based on the mass of cathode material, as well as the following contrast sample).

Prussian blue analogs (PBAs) are widely considered to be one of the most promising types of cathode materials for sodium ion batteries. However, unsatisfactory structural stability upon excessive sodium storage and long-term cycling is still a bottleneck in industrial applications. Herein, a two-pronged approach of single-crystal and high-entropy PBA (SC ...

The battery cycled in 0.4-1.0 V shows a limited cyclability and energy efficiency. By controlling the recharge depth to 0.8 V, the irreversible conversion in 0.8-1.0 V can thus be blocked. The battery operated in the optimized voltage window shows a high capacity of ~118.3 mAh g⁻¹ over 200 cycles. Moreover, a high energy efficiency of ...

Generation of thermal convection flow in the liquid metal battery, a device recently proposed as a promising solution for the problem of the short-term energy storage, is analyzed using a numerical model. It is found that convection caused by Joule heating of electrolyte during charging or discharging is virtually unavoidable. It
